## **COVID: PRELIMINARY RESULTS ARE ENCOURAGING!**

ORYZON presented to the European Congress of Clinical Microbiology & Infectious Diseases (ECCMID) an update on its Phase II ESCAPE trial, which it launched in 2020 to explore the potential for using one of its leading drug candidates to manage patients with severe cases of Covid-19. Given the mechanism of action and anti-inflammatory activity of vafidemstat, the company quickly got this clinical trial up and running in April 2020, so that it could contribute to the collective effort to tackle the newly declared pandemic and help identify a potentially efficacious therapeutic solution. The preliminary results available to date are very encouraging, pointing to a reduction in the most severe symptoms that can lead to acute respiratory distress. We are standing behind our rating and target price.

### ESCAPE, a Phase II trial on 60 randomized patients with severe Covid progressing toward ARDS

On the first day of the 31st European Congress of Clinical Microbiology and Infectious Diseases (ECCMID), taking place from July 9 to 12 2021, ORYZON presented preliminary data from its Phase II trial ESCAPE, evaluating the potential of its drug candidate vafidemstat (ORY-2001) to reduce inflammatory response in patients with severe forms of Covid-19.

ESCAPE is an open-label, randomized, double arm Phase II trial to evaluate the efficacy and tolerability of vafidemstat in combination with standard of care (SoC) treatment in the target indication, to prevent progression of severely ill Covid-19 patients with pneumonia to Acute Respiratory Distress Syndrome (ARDS), one of the leading causes of death in the disease, by reducing the patient's inflammatory response to the infection. Glucocorticoids were the most frequent SoC treatment (83% of patients, equally represented in both arms). The endpoints were assessed at days 5, 14 and 28.

## BIOTECH ORYZON GENOMICS

### Vafidemstat: Rationale for repurposing the drug to treat Covid

Vafidemstat (ORY-2001) is an oral small molecule that has been optimized for central nervous system (CNS) indications. It acts as a covalent inhibitor of the epigenetic enzyme Lysine Specific Demethylase-1, LSD1 (KDM1A), the most abundant Lysine Demethylase in the prefrontal cortex. LSD1 plays a fundamental role in the formation of the CNS, notably in neurogenesis, neuronal differentiation and axonal navigation.

Given the role this protein plays in the development of various disorders, both neurological and oncological, there is a strong rationale for modulating the enzyme, notably via inhibition, as a therapeutic strategy.

The mechanism of action of vafidemstat, an LSD1 inhibitor, acts at two main levels:

- Reduction of cognitive impairment,
- Reduction of neuro-inflammation (effect reported by ORYZON scientists).

In animal models, vafidemstat was shown to restore memory and to significantly reduce the exacerbated aggressiveness observed in SAMP8 mice, a model for accelerated aging and Alzheimer's disease. It also reduced social avoidance and enhanced sociability. And vafidemstat has shown promising results for other severe indications with considerable unmet needs, such as multiple sclerosis (MS). Indeed, vafidemstat exhibited fast, strong and durable efficacy in several preclinical MS models, where it reduced neuro-inflammation (activity of most treatments currently available for MS), and in activities of great medical interest, including modulation of glial activity, neuroprotection and, importantly, the preservation of axonal integrity. Such effects are highly sought after by pharma companies exploring ways to treat neurodegenerative diseases.

The rationale for repositioning vafidemstat as a Covid-19 drug is based on its observed effects on inflammation. In preclinical models of acute inflammation, vafidemstat has been shown to produce a rapid and sharp decrease in IL-6, IL-1B, and other relevant immunomodulatory inflammatory cytokines such as TNF- $\alpha$  and IFN- $\gamma$ . In the recent ETHERAL clinical study in Alzheimer's disease, vafidemstat was shown to be very safe in long-term treatments and also demonstrated a significant decrease in a relevant marker of brain inflammation. This underpins the rationale for the drug's anti-inflammatory effects as well as its good safety profile.

### Strong efficacy signals relative to standard of care in Phase II trial

Between May 2020 and March 2021, 60 patients were randomized in the Phase II ESCAPE trial to determine the safety and efficacy of vafidemstat as an add-on to SoC treatment in Covid-19 severe patients. Follow-up data show that most of the patients in both arms (69% of the total cohort) were discharged before the first week of treatment, while four were admitted to ICU (two from each arm). Overall, vafidemstat appears to improve patients' general condition, since fewer interventions were required in the experimental arm vs. placebo: (i) mechanical ventilation required in 65.5% of the experimental arm (19 patients) vs. 77.4% in the control arm (24 patients), (ii) rescue medication (Tocilizumab = Actemra, ROCHE) required in 33% of the experimental arm (2 patients) vs. 67% in the control arm (4 patients), and (iii) one death due to Covid morbidities versus none in the vafidemstat arm.

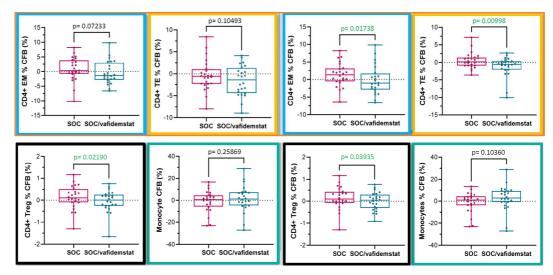

The primary endpoint of the study was to measure the difference in mortality between the vafidemstat + SoC arm vs. placebo + SoC. This endpoint now seems difficult to meet, given how the pandemic has trended and the sharp reduction in Covid-19-related mortality since the epidemic began. Indeed, hospital management of severely ill Covid-19 patients has improved considerably, and existing SoC treatments are proving efficacious in reducing mortality associated with SARS-CoV-2: Within the cohort of 60 patients with severe Covid-19, only one death was reported (in the placebo arm). This is why the primary endpoint set when the ESCAPE trial was being designed—measuring the difference in mortality between the two arms-is not relevant.

## BIOTECH ORYZON GENOMICS

That being said, the data collected show an undeniable clinical benefit, particularly with regard to the need for mechanical ventilation and the rescue medication Tocilizumab.

### Clinical benefit confirmed at the cellular level...

The study showed that treatment with vafidemstat inhibited LSD1 at the cellular and molecular levels, producing significant effects on the immune response induced by Covid-19 infection. This immune response was observed at two levels: (i) circulating immune cell populations, and (ii) inflammatory mediators, including cytokines and chemokines.

### Change in frequency of immune cell subpopulations

Source: ORYZON GENOMICS

Furthermore, distinct changes in the frequency of several circulating immune cell populations were also observed, significantly affecting T CD4+ cell subsets, revealing that vafidemstat in combination with SoC treatment could help to control T-cell activation by significantly reducing the percentage of terminal effector, effector memory, and regulatory T cells. These specific immune cell subpopulations have been previously shown to be elevated in patients with Covid-19 pneumonia. Their presence may make patients more prone to developing a severe form of Covid-19 and a form associated with respiratory distress. Vafidemstat's effect on these cells in particular supports the case for its potential to prevent Covid-19 from evolving into very severe forms.

### ... and the molecular level: Action on cytokines and chemokines

Above and beyond clinical observations, and the drug's effects at the cellular level, treatment with 2.4mg/day of vafidemstat for five days resulted in an almost complete occupancy of the LSD1 target protein, which was sustained in most patients until they were discharged.

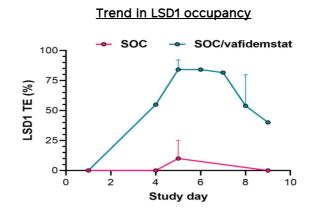

The graph below shows that LSD1 was still 70% occupied on average, even after treatment with vafidemstat ended. It also shows that in the absence of a treatment containing vafidemstat, the LSD1 rate remains low or even nonexistent throughout and after the entire treatment period.

## BIOTECH ORYZON GENOMICS

Source: ORYZON GENOMICS

LSD1 inhibition by vafidemstat resulted in significant effects on the immune response induced by Covid-19 infection both in terms of circulating immune cell populations and inflammatory mediators, including cytokines and chemokines. With regard to inflammatory mediators in particular, a clear tendency for decreased plasma levels of most of the cytokines evaluated was observed after five days of treatment with vafidemstat compared to the immunosuppressor effect already observed with the SoC alone, achieving statistical significance (p<0.05) for cytokines IL-12p70, IL -17A and IFNy. Regarding chemokines, vafidemstat treatment generated a trend towards elevation of RANTES (Regulated upon Activation, Normal T Cell Expressed and Presumably Secreted), known to play an important role in protecting Covid-19 patients from developing severe illness.

## BIOTECH ORYZON GENOMICS

In sum, data collected so far from the ESCAPE trial are fairly encouraging, since the vafidemstat arm has produced better anti-inflammatory indicators than the placebo arm. This is a clear example of the drug candidate's potential, especially when it comes to controlling the escalation of serious events that can potentially lead to severe or very severe illness in Covid-19 patients.

Vafidemstat modulates the immune response of Covid-19 patients at risk of rapidly becoming critical by controlling exacerbated CD4+ T cell activation and the subsequent release of inflammatory cytokines beyond the basal effect of the corticoids. Following the trial with Alzheimer's patients, the ESCAPE trial is the second clinical demonstration of the anti-inflammatory effects of vafidemstat for different indications.

### Satisfactory safety and tolerability profile

In terms of tolerability, the treatment was well tolerated on the whole with 13 adverse events (AEs) reported in 11 subjects during the study, none of them severe or serious. Nine of the AEs were in the vafidemstat + SoC arm, and all were mild and considered non-treatment related. This is an important outcome as it confirms that treatment with vafidemstat plus SoC, mainly corticoids, is safe and well tolerated.

Vafidemstat has to date been administered to more than 250 subjects through the multiple Phase I and II clinical trials completed or ongoing, and has been found to be safe and well tolerated.

### Final results of ESCAPE trial expected within the coming months

Heartened by these results, ORYZON will analyze different parameters to show vafidemstat's full potential for managing patients with Covid-19. Differences between the experimental arm (vafidemstat + SoC) and control arm (placebo + SoC) in terms of clinical response, including days of hospitalization or respiratory parameters, will be analyzed at a later date, once the database is hard-locked.

ORYZON has not yet provided a timeframe for the next steps. It will mainly be analyzing the data gathered under different parameters to measure the benefit of the treatment for patients even if the primary endpoint is not met for now. No additional information is available at this time, but we estimate that the full analysis will become available sometime around the middle of H2 2021.

### Covid-19 treatments: Status of research and approvals

Whereas Covid-19 vaccine makers more or less kept their promise of delivering efficacious solutions in record time (the first vaccine using PFIZER/BIONTECH technology was approved in the UK in December 2020), the road has been bumpier for Covid-19 treatments. In the early days of the pandemic, most were betting on the treatment segment rather than vaccines, but the former is now regarded with great disappointment and skepticism. The fact is that colossal resources were quickly allocated to Covid-19 treatment and a large number of drugs and drug candidates were repurposed due to their known anti-inflammatory, antiviral and/or neuroprotective properties, but there is not much to show for these efforts today.

Yet the need for a treatment that works is undeniable, especially if the virus becomes endemic, as most in the health sector predict will happen. In line with statements from the CEOs of MODERNA and PFIZER, the WHO recently indicated that the most vulnerable will probably need to be vaccinated every year and the rest of the population every other year.

## BIOTECH ORYZON GENOMICS

Moreover, while the vaccines, particularly those using mRNA technology, do appear to offer relatively good protection against Covid-19, a 100% vaccination rate will never be achieved. This means that the risk of severe Covid-19 patients needing hospitalization, respiratory assistance and acute care will remain. It is therefore indispensable to identify treatments that can prevent the disease from progressing to such severe stages, with three primary goals:

- Reduce mortality associated with Covid-19
- Reduce hospitalizations and the risk of hospitals filling up due to a new wave of infections
- Keep contamination in check to limit the risk of spread.

According to Statista, some 5,000 Covid-19 clinical programs were listed as active across the world on the ClinicalTrials.gov website in March 2021, a very large majority of them in the field of therapeutics. It is imperative that all SARS-Cov-2 solutions and strategies be considered as part of a whole. Until such time as a prophylactic approach proves effective in protecting the entire population, despite the potential roadblocks known today (delays in vaccinating low-income areas, emergence of more or less resistant variants, vaccine defiance in certain parts of the population, vaccines offering less than 100% protection, moderate durability of protection, etc.), the therapeutic arsenal must be as broad and complementary as possible. Indeed, even if countries are less focused on the therapeutic segment for now, it remains a priority for public health and within the scientific/medical community that is continuing the R&D work to deliver differentiating solutions. This is especially important if we consider that most experts believe the pandemic could quickly evolve into an endemic, meaning the virus may not be fully eradicated and that we may have to live with different variants during different seasons, similar to the flu.

Number of coronavirus trials conducted between April 2020 and March 2021

## BIOTECH ORYZON GENOMICS

Various therapeutic solutions have already been approved in different parts of the world. In the US, the FDA has issued several emergency use authorizations (EUAs) since April 30, 2020 for different drugs and medical devices. Some of these EUAs have since been amended due to a failure to demonstrate efficacy per the initial use protocol (convalescent plasma and the combination of bamlanivimab/etesevimab antibodies). To date, the FDA has issued 11 EUAs:

- Treatments: Remdesivir, Covid-19 convalescent plasma, Baricitinib, REGEN-COV, bamlanivimab/etesevimab, Sotrovimab, and Actemra.
- Medical devices: MultiFiltrate PRO System by Fresenius, Fresenius Kabi Propoven 2%, REGIOCIT, Propofol-Lipuro 1%.

Europe's EMA has been more conservative, approving only one Covid-19 treatment to date: Veklury (remdesivir). A marketing authorization application is being reviewed for Olumiant (baricitinib), and four other products are under rolling review: the bamlanivimab/etesevimab combo, Regdanvimab, REGN-COV2 and Sotromvimab.

## BIOTECH **ORYZON GENOMICS**

## **INVESTMENT CASE**

ORYZON GENOMICS is a Spanish biotechnology company specializing in the treatment of neurodegenerative diseases and cancer. Specializing in the field of epigenetics, the company aims, in all of its development programs, to identify biomarkers through its genetic and proteomic platforms in order to develop small molecule drugs. The company has delivered interesting results with its most advanced programs in areas more or less invested in terms of overall R&D efforts, cancer but also Covid-19 and cognitive disorders associated with neurodegenerative diseases or disorders of the personality.

## SWOT ANALYSIS

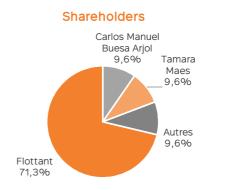

### **WEAKNESSES**

- No partnership
- Risky indications (CNS)
- Intense competition in oncology

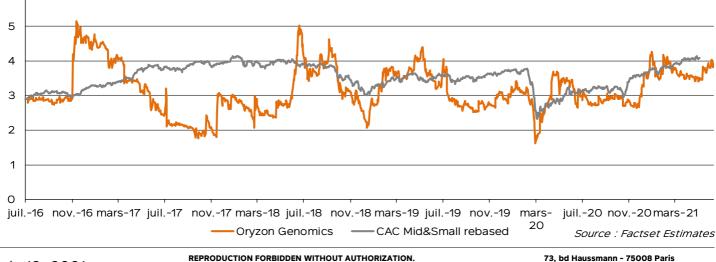

### THREATS

- Clinical and regulatory risk
- Commercial risks
- Legal risks

## DISCLAIMER

Invest Securities is authorized and supervised by the Prudential Control and Resolution Authority (ACPR) and regulated by the Financial Markets Authority (AMF).

This document does not constitute or form part of any offer or invitation to subscribe, buy or sell financial securities, or to participate in any other transaction.

While all reasonable care has been taken to ensure that the facts stated herein are accurate, Invest Securities has not verified the contents hereof and accordingly none of Invest Securities, shall be in any way responsible for the contents hereof and no reliance should be placed on the accuracy, fairness, or completeness of the information contained in this document.

The opinions, forecasts and estimates contained in this document are those of their authors only. The assessments made reflect their opinion on the date of publication and are therefore subject to change or invalidation at any time, without notice. Invest Securities has no obligation to update, modify or amend this document or to inform in any way the recipient of this document in the event that a fact, opinion, forecast or estimate contained in this document, changes or becomes inaccurate.

The investments mentioned in this document may not be suitable for all of its recipients. The recipients of the document are invited to base their investment decisions on the appropriate procedures they deem necessary. It is recalled that past performances do not prejudge future performances. Investing in the markets presents a risk of capital loss. Any loss or other consequence arising from the use of the information contained in the document is the sole responsibility of the investor. Neither Invest Securities nor any other person can be held responsible in any way for any direct or indirect damage resulting from the use of this document. If in doubt about any investment, recipients should contact their own investment, legal and / or tax advisers for advice regarding the advisability of investing.

Research reports including their preparation and distribution are subject to the provisions of market abuse regulation (EU) n°2014/596 and delegated regulation (EU) n°2016/958 on the technical modalities for the objective presentation of recommendations. This document is intended only for professional investors who meet the criteria set out in Annex II of Directive 2014/65/EU, or "qualified investors" within the meaning of the prospectus regulation (eu) 2017/1129.

This document is provided to you on a confidential basis for your information and may not be reproduced or transmitted, in whole or in part, to any other person or published.

## TARGET PRICE AND RECOMMENDATION

Our analyst ratings are dependent on the expected absolute performance of the stock on a 6- to 12-month horizon. They are based on the company's risk profile and the target price set by the analyst, which takes into account exogenous factors related to the market environment that may vary considerably. The Invest Securities analysis office sets target prices based on a multi-criteria fundamental analysis, including, but not limited to, discounted cash flows, comparisons based on peer companies or transaction multiples, sum-of-the-parts value, restated net asset value, discounted dividends.

Ratings assigned by the Invest Securities analysis office are defined as follows:

- > BUY: Upside potential of more than 10% (the minimum upside required may be revised upward depending on the company's risk profile)
- NEUTRAL: Between -10% downside and +10% upside potential (the maximum required may be revised upward depending on the company's risk profile)
- SELL: Downside potential of more than 10%
- > TENDER or DO NOT TENDER: Recommendations used when a public offer has been made for the issuer (takeover bid, public exchange offer, squeeze-out, etc.)
- > SUBSCRIBE or DO NOT SUBSCRIBE: Recommendations used when a company is raising capital
- UNDER REVIEW: Temporary recommendation used when an exceptional event that has a substantial impact on the company's results or our target price makes it impossible to assign a BUY, NEUTRAL or SELL rating to a stock
